# Utensils Hard Anodized

[www.orlinaventures.com](http://www.orlinaventures.com)

- Hard Anodized cookware are scratch proof.
- The surface has been guaranteed for a period of five years against blisters, peeling, rusting, pitting and cracking.
- Any type of spatula can be used on this surface.
- The surface of hard anodized aluminum is 2.4 times harder than stainless steel and about 8 times harder than aluminum.
- The hardness is equivalent to the hardness of the precious stone, sapphire.
- The surface is not a coating but an integral part of the metal.
- Hard anodized cookware are not non-stick. Food does stick on the surface, although a little less than the conventional aluminum cookware.

The cookware are drawn into shape from the highly conductive, virtually pure virgin aluminum. For the cook this means cooking in a pot that is more fuel efficient, scratch resistant and a surface that will not be damaged by metallic spoons and flexible metal spatulas. The heavy gauge aluminum used allows even distribution of heat on the bottom and up the sides of the pots with no hot spots. The hard surface does not interact with or alter the color of the food.

Its ultra smooth surface is extremely easy to clean and does not require any special maintenance. Rivetting in most of the ports has been avoided, this has been done to ensure easier cleaning and no carryover food in the nick of the rivets.

The handles have been especially designed for durability and aesthetic value. They shall remain relatively cool during cooking.
